

Using SELECT statement, you can select specific rows of a table. The orange rows of this picture means that only those rows are selected.

## **Selection**

By using **SELECT statement**, you can select the specific no of rows form the table. You can restrict the rows by applying several conditions. In this case, SELECT statement is used as filtering.

## **Joining**

By using SELECT statement, you can join different types of table. Use join capabilities to bring together data that is stored in different tables by creating a link between different tables.

## **Summary of SELECT statements**

SELECT statements can retrieve data by 3 ways:

- Projection: Select columns
- Selection: Select rows
- Joining: Join different tables data
